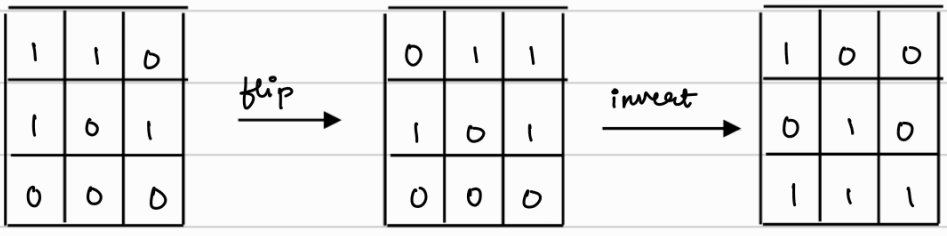
* Problem statement :-

→ We are given an nxn binary matrix.

→ Flip the image horizontally.

→ Invert the image

* Example :-



* Solution :-

→ Reversing horizontally means to reverse the row elements.

→ Inverting bits can be done using matrix[i][j] = matrix[i][j] ^ 1

Time complexity :- $O(n^2)$ (Since it's an nxn matrix)

Space complexity :- $O(1)$
